

Q1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

➤ **ANSWER::**

- **GPU Brand:** Intel
- **GPU Model Number:** Intel UHD Graphics 620
- **Type:** Integrated GPU

if using a dedicated GPU :

- **GPU Brand:** NVIDIA
- **GPU Model Number:** GeForce GTX 1650
- **Type:** Dedicated GPU

Q2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

- **Fan** – It moves air to keep the PC cool and removes hot air.
- **Heatsink** – It absorbs heat from the CPU or GPU and helps cool it down.
- **Liquid Cooler** – It uses liquid to carry heat away from the CPU and keeps it cool.

Q3. Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Factor	Air Cooling	Liquid Cooling
Cost	Cheaper	More expensive
Cooling Efficiency	Good	Better
Maintenance	Easy, little maintenance	Needs more maintenance

Q4. Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3–4 sentences based on your research.

AIR COOLER ::

REASON ::

- I choose air cooling for my GPU.
- Air cooling is cheaper and easy to maintain.
- It provides good cooling for streaming IPL matches and playing graphics-heavy games.
- It is a good choice for most gaming PCs.
