

1. Draw a labeled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage components.

2.

Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use cases.

Hint: Think about which one is faster, which is more shock-resistant, and where you would usually find each type (laptop, gaming PC, etc.).

FEATURE	HDD	SSD
SPEED	Slower Because it uses a Spinning Disk.	Much Faster because it uses memory chips.
DURABILITY	Less durable. It can be damaged if dropped.	More durable, it can handle shocks and drops better.
STORAGE	Give more storage at a lower price.	Costs more but gives better performance.
NOISE	Makes a little noise while working.	Works Silently because it has no moving parts.
TYPICAL USE	Used in desktop PCs and for storing large files.	Used in laptops, gaming PCs, and fast computers.

3.

Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC.

★ Role of CPU, RAM, and GPU in Running Games (PUBG / Free Fire on PC)

1. CPU (Central Processing Unit) :-

The CPU is the brain of the computer. It controls the game, player actions, AI, and physics. It also works with other computer parts. A faster CPU helps games like PUBG and Free Fire run smoothly.

2. RAM (Random Access Memory) :-

RAM stores the game data while the game is running. It helps the CPU access data quickly. More RAM makes games load faster, run smoothly, and reduces lag.

3. GPU (Graphics Processing Unit) :-

The GPU creates the game graphics, such as characters, maps, lighting, and effects. A powerful GPU gives better image quality, higher FPS, and smoother gameplay in games like PUBG and Free Fire.

4.

Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each.

1. Processor (CPU)

Upgrade the CPU for faster game performance. It helps FIFA run smoothly without slowing down.

2. RAM

Upgrade the RAM to 16 GB or more. It makes the game load faster and reduces lag.

3. Graphics Card (GPU)

Upgrade the graphics card for better graphics and higher FPS. It gives a smoother gaming experience.

4. SSD

Upgrade to an SSD for faster game loading. It also makes Windows and FIFA start quickly.

5. Power Supply (SMPS)

Upgrade the power supply if you install a new GPU or CPU. It provides enough power for all the computer parts to work safely.
